

CS205 C/ C++ Programming - Lab Assignment 1

Name: 唐千栋(Qiandong Tang)

SID: 11612730

Part 1 - Analysis

The problem is to calculate the distance between two cities. We have to read the name, latitude and longitude of two's cities. Then calculate the distance and output. Because the angle, which is described in the statement, is measured with degree, we need to first convert degree to radian.

$$\begin{aligned} \phi_i &= 90 - \text{Latitude} \\ \theta_i &= \text{Longitude} \\ c &= \sin(\phi_1) * \sin(\phi_2) * \cos(\theta_1 - \theta_2) + \cos(\phi_1) * \cos(\phi_2) \\ d &= R * \arccos(c) \end{aligned}$$

Part 2 - Code

```
1  #include <cmath>
2  #include <cstdio>
3  #include <iostream>
4  #include <string>
5  using namespace std;
6
7  const int maxn = 1e3 + 10;
8  const double PI = acos(-1);
9
10 char s1[maxn];
11 char s2[maxn];
12
13 double phi1, phi2;
14 double theta1, theta2;
15 string buffer;
16
17 double get_arc(double x) { return x * PI / 180; }
18
19 int main() {
20     printf("Please input the first city: <city name>\n");
21     cin.getline(s1, maxn);
22     printf("Please input <latitude> <longitude>\n");
23     scanf("%lf%lf", &phi1, &theta1);
24     getchar();
25     printf("Please input the second city: <city name>\n");
26     cin.getline(s2, maxn);
27     printf("Please input <latitude> <longitude>\n");
```

```

28     scanf("%lf%lf", &phi2, &theta2);
29
30     phi1 = 90 - phi1, phi2 = 90 - phi2;
31     phi1 = get_arc(phi1);
32     phi2 = get_arc(phi2);
33     theta1 = get_arc(theta1);
34     theta2 = get_arc(theta2);
35
36     double c = sin(phi1) * sin(phi2) * cos(theta1 - theta2) + cos(phi1) *
cos(phi2);
37     double d = 6371 * acos(c);
38
39     printf("The distance between %s and %s is %.2f km\n", s1, s2, d);
40     return 0;
41 }
42

```

Part 3 - Result & Verification

The verification is combined with the result queried in the website.

Test case #1:

```

1  Input:
2  Shenzhen
3  22.55 114.1
4  Paris
5  48.8567 2.3508
6  Output: The distance between Shenzhen and Beijing is 9601.85 km

```

```

→ Assignment1 git:(master) X ./Assignment1
Please input the first city: <city name>
Shenzhen
Please input <latitude> <longitude>
22.55 114.1
Please input the second city: <city name>
Paris
Please input <latitude> <longitude>
48.8567 2.3508
The distance between Shenzhen and Paris is 9601.85 km

```

Part 4 - Difficulties & Solutions

1. The difficulty is to convert degree to radian.
We can multiply degree with $\pi/180$ to get radian.
2. The second problem is how to read a line from input.
We can use `cin.getline()` to read a line.
